

AGiORA

Autonomous Prediction Markets

A fully autonomous, AI-powered platform
designed for infinite scale.

What we built

The Core Innovation:

We eliminate the operational bottlenecks in the prediction market lifecycle through three pillars:

- 1. User-generated markets
- 2. AI automation & resolution
- 3. Automated, crowd-funded market liquidity

The entire pipeline — from market creation to final payout — runs autonomously, without centralized intervention.

How It Works:

The Autonomous Lifecycle

■ MARKET

User creates a question and invests an initial seed (\$1 – \$100).

■ FILTER

AI reviews the proposed market to ensure quality and rule enforcement.

■ FUND

The crowd joins the bankroll (softcap: \$100).

■ LIQUIDITY

The bankroll pool auto-funds the market's liquidity.

■ TRADE

CLOB trading begins (YES + NO = \$1.00); bots provide constant liquidity.

■ RESOVLE

AI determines the outcome based on cited sources.

■ DISPUTE

Escalating dispute mechanism opens with economic incentives.

■ PAY

Winners redeem payouts, fees are distributed, and capital is recycled.

Core Trading Engine

■ Technical Infrastructure

- **Matching:** Central Limit Order Book (CLOB) for institutional-grade matching.
- **Pricing:** Binary outcomes where YES + NO always sum to \$1.00.
- **Order Mirroring:** Single unified book (e.g., BUY YES @ 40¢ = SELL NO @ 60¢).
- **Settlement:** USDT on-chain.

■ Fee Structure

- **Taker Fee:** 0.2%
- **Maker Fee:** \$0
- **Redemption Fee:** 2% on winning payouts.

Liquidity Providers

The Bankroll Model

■ Capital Allocation (Softcap: \$100)

- **80%** of the bankroll goes to market liquidity.
- **20%** of the bankroll goes to platform products and incentives.
- Every market bootstraps its own liquidity.
- Bigger bankroll = deeper order book.
- Zero platform capital required.

■ Bankroller Yield

Providers are economically incentivized to fund markets, earning:

- **50%** of market trading fees.
- **50%** of market redemption fees.
- **100%** of redemption fees generated from liquidity
- provisioning.

AI Filtration Resolution & Dispute System

■ 1. AI Market Filtration

- Reviews user-proposed markets to guarantee quality and clarity.
- Enforces proper rule structure.
- Blocks inappropriate, subjective, or harmful markets.

■ 2. Autonomous Resolution (LLM + Search)

- When a market expires, AI agents gather evidence from multiple independent sources.
- Proposes a definitive outcome alongside a confidence score and cited sources.
- A 24-hour public dispute window automatically opens.

■ 3. Human-Escalated Disputes (Game Theory)

The escalating cost creates a natural convergence: frivolous disputes become prohibitively expensive, while legitimate challenges get thoroughly re-evaluated.

- Anyone can initiate a dispute starting at **\$1**.
- The price to dispute **escalates by 1.25x** per round.
- Each dispute adds **1 additional hour** to the resolution window.
- The AI re-evaluates the outcome using the newly submitted dispute evidence during each round.
- The market finalizes only when a full round passes with zero disputes.

Roadmap Lumberworks

Next Phase

For sports events, automation extends even further. Lumberworks auto-creates markets directly from real bookmaker odds.

Dynamic Odds Pricing:

Unlike traditional prediction markets that start at a neutral 50/50, sports markets start at actual probability.

Example:

- API fair odds show Underdog 10.63% / Favorite 89.37%.
- Initial Pricing: YES = \$0.11 | NO = \$0.89.
- Our bots seed the grid around these real odds and dynamically update as the API odds shift.
